

Remember 4th June 2025 ?

Yes, the day RCB won its 1st IPL trophy and gave us many happy movements!!

BUT NOT EVERY MOMENT WAS HAPPY.

(While the city celebrated, the **system struggled to respond)**

[Home](#) / [India News](#) / 11 dead, 33 injured at Chinnaswamy amid RCB's IPL celebration; PM condoles

**11 dead, 33 injured at Chinnaswamy amid RCB's
IPL celebration; PM condoles**

It took the Chinnaswamy stadium tragedy for Bengaluru police to **change its crowd-control strategy**

For city police, the tragedy was a wake-up call that prompted reforms in event preparedness, communication, intelligence gathering, and the **use of technology for managing large-scale events.**

Published – June 04, 2026 06:01 am IST – Bengaluru

**AFTER THE INCIDENT, EVERYTHING
changed.**

**and, We asked 1 simple question:
What if the people managing the city knew earlier?**

That **Question Actually leads us to
choose this problem statement and
build “**Urban-flow.ai**”**

**“An AI system that predicts congestion, simulates scenarios, and
supports in decisions making before chaos begins.”**

so,IMAGINE IT'S YOUR FIRST DAY

Your senior officer is absent.
A major event is about to begin.
You need to plan for the event

- What roads to close?
- Where do ambulances go?
- How many officers are needed?

Keeping all such a situation in mind, we designed **UrbanFlow** for the **inexperienced officer** facing the city's toughest moments.

Whom We Are Actually Serving ?

1. EVENT OFFICER

- Predicts event impact before the crowd arrives.
- Plans resources such as officers and barricades.
- Prepares the city before the event begins.

2. TRAFFIC OFFICER

- Receives road diversions and traffic plans.
- Gets deployment priorities for critical junctions.
- Responds before congestion spreads.

3. HOSPITALS

- Identifies safe emergency corridors.
- Avoids affected and congested zones.
- Protects ambulance movement when seconds matter

These aren't random stakeholders.
They represent the chain of decisions that keeps a city moving

#Features vs Novelty.

Features -:

1. AI Impact Analysis

(Predict congestion, delays, and impact zones).

2. AI Confidence Score

Explain predictions using dataset provided to us

"These aren't the AI-generated photos

They are from our dashboard, the same applies to all photos afterward"

3.Resource Recommendation

(Recommend officers, barricades, tow trucks, and fire units).

4.Before vs After Analysis

(Measure the effectiveness of interventions.)

07 Before vs After Intervention

METRIC	BEFORE	AFTER	IMP.
Congestion	90%	38%	+58%
Delay	84 min	37 min	+56%
Avg. speed	18 km/h	31 km/h	+72%
Overall improvement score			62%

#NOVELTY

This SECTION Is where our team Come UP With most creativity and real problem solving skill

1. Deployment Priority

Beyond resource counts [Urban flow.ai](#) gives development priority based on camera feed

2. Bmtc & Metro Footfall

When roads are diverted, the pressure shifts to public transport. UrbanFlow predicts the impact before it happens.

(with Numb. of officers needed to handle the situations)

#Our Personal Favourite Novelty.

These features Actually reflect how deeply our team studied real-world traffic operations.

3. Scenario Simulator

We understand that in real situations, resources are never enough. So **UrbanFlow** lets officers try different plans and understand the risks. and yes, the sliders is completely interactive

4. Export-Pdf★

There is no point in building an AI system if we cannot preserve and share its insights. So we introduced Export Report. It summarizes all the insights into a single PDF report. These reports can be shared with future officers and departments, helping them prepare better if a similar event occurs again.

#Our Goal !!

**Next Time When The Crowd Arrives,
THE CITY SHOULD ALREADY BE READY.**
